## Olimpiad Matematik Antarabangsa (OMA)/International Mathematical Olimpiad ke-52 (IMO2011)

Pertandingan kali ini diadakan di Belanda. Soalan disediakan dalam bahasa-bahasa yang diingini oleh negara peserta. Negara-negara yang berbuat demikian ialah setiap negara dari Eropah, Timur Tengah, Timur, Asia Tenggara kecuali Filipina dan Singapura (kedua-duanya menggunakan bahasa Inggeris), dan juga Afrika Selatan (walaupun bahasa rasmi utamanya Inggeris). Ini menjadikan jumlah bahasa yang digunakan ialah 49 buah bahasa daripada 101 buah peserta semuanya.

Berikut soalan itu dalam bahasa Melayu Malaysia:

Masalah 1. Diberi sebarang set  $A = \{a_1, a_2, a_3, a_4\}$  yang terdiri daripada empat integer positif berlainan. Namakan hasil tambah  $a_1 + a_2 + a_3 + a_4$  sebagai  $s_A$ . Andaikan  $n_A$  mewakili bilangan pasangan  $(i, j)$  dengan  $1 \leq i < j \leq 4$

supaya  $a_i + a_j$  membahagi  $s_A$ . Cari semua set  $A$  yang terdiri daripada empat integer positif berlainan supaya nilai  $n_A$  adalah sebesar mungkin.

Masalah 2. Andaikan  $S$  suatu set terhingga yang terdiri daripada sekurang-kurangnya dua titik pada suatu satah. Andaikan tiada tiga titik dalam  $S$  yang segaris. Suatu kincir ialah suatu proses yang bermula dengan suatu garis  $l$  yang melalui satu titik  $P \in S$ . Garis ini berputar mengikut arah jam menggunakan  $P$  sebagai sendi sehingga garis ini melalui satu titik lain dalam  $S$ . Titik ini, yang dinamakan  $Q$ , mengambil alih peranan sebagai sendi yang baru, dan garis ini terus berputar mengikut arah jam bersendikan  $Q$  sehingga ia melalui titik seterusnya dalam  $S$ . Proses ini berterusan tanpa henti.

Buktikan bahawa suatu titik  $P$  dalam  $S$  dan suatu garis  $l$  yang melalui  $P$  boleh dipilih supaya kincir yang terhasil akan menggunakan setiap titik dalam  $S$  sebagai sendi tak terhingga kali banyaknya.

Masalah 3. Andaikan  $f : R \rightarrow R$  suatu fungsi nyata yang tertakrif pada set nombor nyata yang memenuhi  

$$f(x + y) \leq yf(x) + f(f(x))$$

untuk semua nombor nyata  $x$  dan  $y$ . Buktikan bahawa  $f(x) = 0$  untuk semua  $x \leq 0$ .

Berikut soalan itu dalam bahasa Melayu Indonesia:

Soal 1. Diberikan sebarang himpunan  $A = \{a_1, a_2, a_3, a_4\}$  dari empat bilangan bulat positif berbeda, jumlah  $a_1+a_2+a_3+a_4$  didefinisikan dengan  $s_A$ . Misalkan  $n_A$  menyatakan banyaknya pasangan  $(i, j)$  dengan  $1 \leq i < j \leq 4$  sehingga  $a_i + a_j$  membahagi  $s_A$ . Cari semua himpunan  $A$  dari empat bilangan bulat positif berbeda yang merealisasikan nilai  $n_A$  terbesar yang mungkin.

Soal 2. Misalkan  $S$  adalah suatu himpunan hingga dari paling sedikit dua titik pada bidang tertentu. Asumsikan bahwa tidak ada tiga titik dari  $S$  yang segaris. Suatu pusaran adalah suatu proses yang dimulai dengan suatu garis  $l$  melalui suatu titik tunggal  $P \in S$ . Garis itu berputar searah putaran jarum jam dengan pusat  $P$  sampai waktu pertama garis itu bertemu suatu titik lain anggota  $S$ . Titik ini,  $Q$ , mengambil alih sebagai pusat baru, dan garis itu sekarang berputar searah putaran jarum jam dengan pusat  $Q$ , sampai garis itu bertemu suatu titik berikutnya dari  $S$ . Proses ini berlanjut secara terus menerus.

Buktikan bahawa kita dapat memilih suatu titik  $P$  di  $S$  dan suatu garis  $l$  melalui  $P$  sehingga pusaran yang dihasilkan menggunakan masing-masing titik dari  $S$  sebagai pusat tak hingga banyak kali.

Soal 3. Misalkan  $f : R \rightarrow R$  adalah suatu fungsi bernilai real terdefinisi pada himpunan bilangan real memenuhi  

$$f(x + y) \leq yf(x) + f(f(x))$$

untuk semua bilangan real  $x$  dan  $y$ . Buktikan bahawa  $f(x) = 0$  untuk semua  $x \leq 0$ .

Keputusan pertandingan seperti berikut:

10 Negara di Atas :

- 1) Republik Rakyat China; 2) AS; 3) singapura; 4) Rusia; 5) Thailand; 6) Turki; 7) Korea Selatan; 8) Romania; 9) Taiwan; 10) Iran

## **LAPORAN SEMINAR DSBNYA DI MALAYSIA JULAI-DIS 2011**

### **Seminar Setengah Hari Komputeran Grid (*Grid Computing*) dan Pengkomputeran Awan (*Cloud Computing*).**

Pada 14 Julai 2011 bertempat di Pusat Teknologi Maklumat telah diadakan Seminar Setengah Hari Pengkomputeran Grid (*Grid Computing*) dan Pengkomputeran Awan (*Cloud Computing*). Dr Hong Ong dari MIMOS telah berkongsi ilmu dengan peserta. Juga berkongsi pengalaman ialah Sdr Farhan dari UPM.

Apakah sebenarnya komputeran grid? Secara mudah komputeran grid ialah hasil pengkomputeran yang berkongsi kuasa pemprosesan dari komputer di pelbagai institusi yang mempunyai kelebihan sumber yang biasanya tidak digunakan sepenuhnya di tempat sendiri.

Biasanya atur cara yang besar dan kompleks memerlukan kuasa pemprosesan yang tinggi seperti ramalan cuaca, reaktor nuklear, simulasi ekonomi negara dan sebagainya yang memerlukan kuasa pemprosesan yang besar, kadang-kadang sehingga 100,000 pemproses (prosesor) dan dilakukan secara selari.

Secara lebih tepat, komputeran grid ialah kombinasi infrastruktur perkakasan dan perisian komputer yang digabung bagi memudahkan pelaksanaan tugas komputeran tingkat tinggi (*high-end computing*).

Ian Foster dan Carl Keselman telah mencipta “*Global Toolkit*” bagi memudahkan komputeran grid yang bersifat sumber piawai yang koordinasikan, sumber terbuka (*open source*), protokol kegunaan umum, memberikan perkhidmatan yang tidak remeh dan mempunyai perkakasan madya (*middleware*) untuk koordinasi.

Komponen utama dari komputeran grid ialah organisasi maya (OM; *virtual organization(VO)*) yang menjadi titik masuk pengguna komputeran grid. Siapa yang ingin mengguna kemudahan komputeran grid mestilah menjadi ahli organisasi maya terlebih dahulu.

Mulai tahun 2005 hingga tahun 2007, komputeran awan (*cloud computing*) mula diminati oleh pengguna, kumpulan yang terkenal ialah Komputeran Awan Nebula (*Nebula Cloud Computing*). Melalui komputeran awan pengguna tidak perlu lagi membeli perisian yang mahal-mahal, ianya terdapat di internet dan bayaran terhadap penggunaannya dikira berdasarkan masa atau tahap penggunaan perisian tersebut.

Secara jelasnya, komputeran awan merupakan jenis komputeran yang berasaskan utiliti (penggunaan); sesiapa yang memerlukan sesuatu perisian tertentu akan hanya menyatakan keperluannya melalui organisasi maya masing-masing yang kemudiannya akan menghubungi pemilik perisian tersebut untuk memberikan masa penggunaan dengan kadar bayaran tertentu. Pihak pengguna tidak lagi perlu menguruskan lesen perisian, dan lain-lain yang berkaitan dengan perisian tersebut. Apa yang mereka perlu ialah menggunakan perisian tertentu dan ia ada di awan (*cloud*).

Bagi memudahkan pelaksanaan komputeran awan, berbagai model diutarakan seperti model persendirian, komuniti, awam dan juga hybrid.

Pihak MIMOS mempunyai (Serahan Kerja Aliran Kerja Labuhan Gred-P (*P-Grade Portal Workflow Job Submission*) sebagai kemudahan bagi sesiapa yang memerlukan perkhidmatan pengkomputeran. Pada dasarnya, mereka menyediakan pentas untuk ahli sains pengkomputeran (*computational scientist*), bukan kepada ahli sains komputer, kerana ahli sains komputer boleh mengadakan sendiri kemudahan pengkomputeran melalui kepakaran mereka sendiri.

Kepada yang ingin mendapatkan maklumat lanjut mengenai komputeran grid dan juga komputeran awan, boleh ke laman web, <http://www.hongong.org/>.

Semoga kita menjadi masyarakat yang celik teknologi maklumat dan menjadi masyarakat yang berpengetahuan.

Drp. Dr. Ismail Abdullah, USIM

### **Seminar Sehari Etnosains dan Etnomatematik**

Apa maknanya Etnosains dan Etnomatematik? Mungkin ini yang sedang bermain di benak fikiran kita. Secara ringkas etnosains merupakan sains yang berasaskan bangsa tertentu, juga etnomatematik bermakna matematik berasaskan kepada bangsa tertentu. Pada 2 Julai 2011, telah berlangsung “Seminar Etnosains dan Etnomatematik Rumpun Melayu” di Institut Penyelidikan Matematik (INSPEM), Universiti Putra Malaysia (UPM). Tajuk-tajuk yang dibincang termasuklah:

- 1) Islamisasi Perubatan Tradisional Melayu dalam Sejarah (PM Dr Nurdeng Durasesh, UPM),
- 2) Wacana Pengislaman Sains di Malaysia: Respond an Signifikan dalam PemikiranTokoh Pemikir Melayu-Islam (Mahadi Abu Hassan, UTeM),
- 3) Persamaan Bentuk Perahu dari Lembangan Mekong dengan Perahu-Perahu di Semenanjung Malaysia: Imitasi atau Improvisasi? (PM Dr. Pisol Maidin, UiTM),
- 4) Sejarah Perkembangan Wacana Pengislaman Sains (Maisarah Hasbullah, UM),
- 5) Set Kata Ganda Bebas dan Masalah Pentakrifan Set dalam Bahasa (Mohd Yunus Sharum, UPM),
- 6) Penggabungan Beberapa Kebajikan Dalam Jadual Hayat Untuk Insurans Takaful Keluarga (Prof Dr Ismail Mohd, UMT),
- 7) Penyelidikan Bandingan Terhadap Manuskip Faraidh Aceh (Dr Salmawaty, USK, Aceh),
- 8) Struktur dan Isi dari Sebuah Manuskip Tabel Faraidh dan Potensi Pemanfaatannya pada Masa Kini (Dr Said Munzir, USK, Aceh),
- 9) Konsep Ekonomi Manfaat Melayu (Dr Mohammad Alinor Abdul Kadir, UKM),
- 10) Unsur Matematik Dalam Pantun Melayu (Sharifah Kartini Said Husain, UPM),
- 11) Dialektologi Memperkaya Etnosains-Matematik Melayu (Mohd Tarmizi Hasrah, UKM).

## **HADIAH NOBEL SAINS MATEMATIK 2011**

Hadiah Nobel atas nama “Sains Matematik” memang tiada tetapi pemenang Hadiah dalam sains teori terutamanya atas nama “Sains Ekonomi” dan “Fizik” bahkan “Kimia” biasanya boleh dianggap seorang ahli sains matematik (fizik teori atau ekonomi teori).

Pemenang Hadiah Nobel Fizik 2011 dimenangi oleh tiga orang fizikawan uji kaji: Saul Perlmutter, Brian P. Schmidt dan Adam G. Riess “kerana penemuan pengembangan memecut bagi Lalam Semesta menerusi cerapan supernova yang jauh” (*“for the discovery of the accelerating expansion of the Universe through observations of distant supernovae”*).

Di dalam Sains Ekonomi, Hadiah Nobel 2011 dimenangi oleh Sargent dan Sims “Kerana penyelidikan empirik mereka tentang sebab dan kesan dalam makroenomi” (*“for their empirical research on cause and effect in the macroeconomy”*)

Oleh itu, **tiadalah pemenang Hadiah Nobel 2011** dalam sains matematik

## **PINGAT FIELD 2010**

PINGAT FIELD DICIPTA OLEH KOMUNITI AHLI MATEMATIK TULEN BAGI MENGGANTIKAN HADIAH NOBEL. NAMUN HADIAHNYA AMATLAH KECIL BERBANDING DENGAN NILAI HADIAH NOBEL

Four 2010 Fields Medalists were announced August 19 at the International Congress of Mathematicians in Hyderabad, India: [Cédric Villani](#) of the Henri Poincaré Institute in Paris (de l'Université de Lyon), [Stanislav Smirnov](#) of the Universite de Geneva (*Section de mathematiques*), [Ngô Bao Châu](#) of the University of Paris XI, and [Elon Lindenstrauss](#) of the Hebrew University of Jerusalem.

Prof. Villani

Prof. Smirnov

Prof Chau

Prof. Lindenstrauss

Villani diiktiraf sebahagian besarnya kerana “pentafsiran matematik beliau dengan tajallinya/profaunnya tentang konsep fizik entropi, yang beliau terapkannya untuk menyelesaikan masalah-masalah utama yang diilhami oleh fizik”. Demikiasn mengikut profil beliau di laman sesawan Kongres Antarabangsa Matekawan (KAM, atau International Congress of Mathematicians (ICM) ).

Mengikut sesawang itu lagi, Smirnov, "memberi bukti yang elegan tentang dua buah konjektur asasi dalam fizik statistik yang tercegak-lama" – satu daripadanya berhubung dengan perkolasian dan satu lagi berhubung dengan perkara yang dirujuk sebagai model Ising daripada mekanik statistik , yang ada terapan/aplikasi dalam kemagnetan"— “penemuan simetri yang mengejutkan dalam model-model matematik daripada fenomenon fizik.”

Châu (Perancis-Vietnam) disanjungi kerana bukti beliau terhadap usulan yang dikenali sebagai Lema Asasi . "Usulan ini ialah matematik tulen yang dalam, dan berkerelevan dengan dunia keilmuan, termasuk fizik tenaga-tinggi, sains komputer dan kriptografi.". Demikian kata Peter Constantin, kerusi Jabatan Matematik University of Chicago.

Lindenstrauss, tidaklah berkelebihan dalam beberapa kesempurna-jayaan yang tidak mampan itu sahaja tetapi beliau menang kerana “ hasil-hasil karya beliau berkenaan dengan sukatan ketegaran dalam teori ergodik, dan keterapan perkara ini dalam teori nombor”. Teori ergodik beliau, mengikut profil sarjana ini, membabitkan telatah sistem dinamik.

**Matinya Herbert Hauptman, Seorang Matematikawan Pemenang Hadiah Nobel**

Herbert Hauptman, who won the [Nobel Prize in chemistry in 1985](#) for work uncovering the structure of molecules that accelerated medical research and led to the development of new drugs, has died on 23<sup>rd</sup> October 2011. He was 94.

Hauptman, a mathematician, received the Nobel Prize three decades after setting out to solve a problem that other scientists had given up on: how to determine molecular structures using X-ray crystallography. He shared the prize with chemist Jerome Karle, with whom he developed mathematical equations to interpret the patterns formed by X-rays scattered from crystals.

He was born in New York City on Feb. 14, 1917. His father was an Austrian immigrant who worked as a printer. He earned a bachelor's degree in mathematics from City College of New York in 1937, a master's in mathematics at Columbia University in 1939, and completed his doctorate in mathematics from the University of Maryland in 1955. At the naval lab he teamed up with Karle, a former City College classmate, to investigate molecular structure using mathematics. Most of the work that led to their joint Nobel Prize was conducted between 1950 and 1956. Their mathematical approach was controversial among chemists and was ignored for years. Its acceptance grew in the 1970s as the introduction of computers made their techniques easier to apply. The method became indispensable to modern chemistry and the pharmaceutical industry because it allowed scientists to "make three-dimensional representations of drugs so that we understand what they look like in space and can understand how they work," said Eaton Lattman, chief executive of Hauptman-Woodward. "I don't think there's a single pharmaceutical that's been developed in the last 30 years that hasn't been studied using derivations of what Dr. Hauptman and his colleagues won the Nobel Prize for."

He was a professor at the University at Buffalo, a member of the National Academy of Sciences and author of three books. A violin player, Hauptman loved classical music and, as a hobby, made stained-glass artwork inspired by mathematical shapes. A collection of his work is displayed at Hauptman-Woodward.

Jerry was a distinctive individual, known for his generosity as a mentor of students and young colleagues and as a communicator to diverse audiences, as well as for having boundless energy and an extraordinary ability to find and exploit the underlying mathematical principles behind issues in science and engineering. He assisted Abraham in the writing of *Foundations of Mechanics*, Choquet with the three-volume *Lectures on Analysis*, and Wightman with his *Lectures on Statistical Mechanics*. The book with Abraham went through several subsequent incarnations; it became, and has continued to be, one of the central texts in the field known as geometric mechanics, wherein methods from symplectic geometry are applied to problems concerning the motion of particle and continuum systems. In addition to this and other graduate-level books, Jerry was well-known as the author of numerous widely used texts for lower-division calculus and upper-division real analysis and complex analysis.

In 1968, Jerry completed his Ph.D. thesis, under Wightman's direction, on "Hamiltonian One Parameter Groups and Generalized Hamiltonian Mechanics." This work, on flows generated by nonsmooth hamiltonians, was motivated in part by problems of hamiltonian dynamics in infinite dimensions, the subject of much of Jerry's later work on continuum mechanics. Rereading the thesis today, one also sees ideas which have reappeared recently in the "pure" mathematical theory of continuous hamiltonian dynamics in finite dimensions.

The beginning of the 1970s saw Jerry's major work with David Ebin, in which they applied infinite-dimensional geometric analysis to prove uniqueness and short-time existence of solutions to the Euler equations of motion for ideal, incompressible fluids. At the same time, he began a series of papers with Arthur Fischer, Vincent Moncrief, and others on the hamiltonian structure of Einstein's evolution equations. This work developed into a more general interest in the hamiltonian formulation of field equations in the so-called multisymplectic formalism.

In the early 1970s, following work by Stephen Smale on celestial mechanics, Jerry, along with Alan Weinstein, introduced a construction in symplectic geometry now widely known as “Marsden-Weinstein reduction.” This construction, which produces smaller symplectic manifolds from symplectic manifolds on which symmetry groups act, has found application, not only in geometric mechanics, but also in such diverse areas of mathematics and physics as algebraic geometry, representation theory, and topological field theory.

In the late 1970s and early 1980s, Jerry added several new topics to his wide range of interests, including classical field theory, bifurcation theory, geometric phases, and control theory. With Weinstein, he began to find applications of symplectic reduction to the hamiltonian formulation of dynamical equations for plasmas, fluids, and other continuum systems, leading to a broad spectrum of results on equilibria and their stability. Jerry continued to pursue these applications with many collaborators, notably Darryl Holm and Tudor Ratiu.

Toward the middle of the 1980s, as Jerry's work on control theory began to move to the center of his attention, his research shifted gradually towards engineering mathematics. During the last 15 years of his life, following his move to Caltech, Jerry added yet more topics to his list of interests, including nonholonomic mechanics, structure preserving algorithms, variational calculus for mechanical systems (both continuous and discrete), mission design for spacecraft, and the application of Dirac structures to electrical networks. At the same time, he worked on foundational problems in Lagrangian mechanics, particularly in connection with reduction.

Jerry never dropped a subject; he only added to his list of interests. As a result, he saw bridges between very different areas. For example, he would apply ideas from relativity to elasticity, thereby arriving at remarkable foundational results. Or he would use geometric mechanics ideas in numerical algorithms. Control theory and dynamical systems techniques would find their way into spacecraft mission design, asteroid orbit analysis, or studies of molecular motion. Discrete differential geometry or locomotion problems would be treated using geometric mechanics and Dirac structures.

*He leaves behind an applied mathematics school that he created by importing geometric and dynamical systems ideas into diverse applied areas such as numerical analysis, classical applied mathematics, theoretical physics, and engineering. He created strong links between pure and applied mathematics as well as between mathematics and various areas of physics, engineering, and chemistry. His ideas have influenced generations of researchers who have used geometry in their work.*

## **Robert Osserman, noted Stanford mathematician, dies at 84**

Robert Osserman died Nov. 30, 2011 at his home in Berkeley. He was 84. Osserman received his PhD from Harvard University, where he wrote his thesis under the direction of Lars Ahlfors. He initially worked in the field of Riemann surfaces and complex analysis. His monograph *Survey of Minimal Surfaces*, first published in 1969, with a second edition in 1986, remains a standard reference in the subject and has introduced this beautiful subject to generations of mathematicians. Minimal surfaces and their generalizations are central to geometric analysis, an area of research that has connections to many areas in physics, the calculus of variations, Riemannian geometry and partial differential equations. During his tenure as chair of Stanford's math department and for the decade that followed, Osserman played a key role in hiring and nurturing many of the world's best mathematicians in this area, helping the university to become a world leader in this very important field of mathematics.

For several years in the 1980s he collaborated with Professors Sandy Fetter, physics, and James Adams, mechanical engineering, to design and teach the course *Values in Technology, Science and Society*. This was an innovative project intended to teach mathematical, physics and engineering principles to undergraduates majoring in nontechnical fields. That experience was the beginning of an exploration that led to him to write *Poetry of the Universe: A Mathematical Exploration of the Cosmos*, which was published in 1992. The popular science book brought in themes from Dante and elsewhere to describe the geometry behind modern cosmology. He was elected a fellow of the American Association for the Advancement of Science in that same year.

With astronaut Michael Foale, he produced a film called *The Right Spin*, about the use of mathematics to put the space station Mir into a regular spin after a failed docking attempt induced a tumbling motion that prevented the solar panels from facing the sun. Without power, navigation was impossible, evacuation was inevitable, and Mir would have burned up re-entering Earth's atmosphere. The film is available as a DVD from the American Mathematical Society.

Sir Michael Dummett

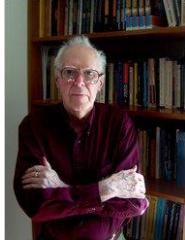

Sir Michael Dummett, Wykeham Professor of Logic at Oxford passed away peacefully at home on 27 December 2011.

One of the most important philosophers of the English speaking world in the second half of the 20th century has died at the age of 86. Professor Sir Michael Dummett was Wykeham Professor of Logic in the University of Oxford. He was enormously influential as a philosopher through major publications and supervision of many outstanding graduate students. He also played a significant role throughout his career combatting racism in the United Kingdom, and when he was knighted, it was "for Services to Philosophy and to Racial Justice". He was also a world authority on voting procedures, a highly theoretical study of the very practical problem how to ensure that voting systems deliver fair results free, as much as possible, from distortion by tactical voting.

## Martin Gardner (1914–2010)

Martin Gardner (1914–2010) took no mathematics courses after high school. He attempted to learn calculus in college but failed. He graduated from the University of Chicago with a bachelor's degree in philosophy. He did a year of graduate study, but earned no advanced degree. Gardner was the ultimate polymath. His passion for mathematics stayed with him his entire life. He wrote seventy books on mathematics and related topics. His column in *Scientific American*, which ran for more than twenty-five years, was read worldwide and had an enormous influence over popular interest in mathematical topics. Perhaps Gardner's most successful book was one of his first. *The Annotated Alice* was greatly popular, and is still in print today. He got his start in publishing as the editor of *Humpty Dumpty* magazine, a children's periodical. The paper-folding puzzles that Gardner designed for *Humpty Dumpty* led to his first contact with *Scientific American*. Gardner began his Mathematical Games column in the latter magazine in 1956 and continued it until 1981. Gardner is remembered for introducing his reading public to

Flexagons; John Horton Conway's Game of Life; Polyominoes; Paradoxes such as the unexpected hanging; Fractals; The work of M. C. Escher; Penrose tiling; Piet Hein's superellipse; Random walks; Graceful graphs; Worm paths; Minimula sculpture; Newcomb's paradox; Nontransitive dice; The board game Hex; Public key cryptography; The Kakeya needle problem; And there are dozens more.

Gardner had many interests. He was an expert magician. He was a noted skeptic and took great interest in debunking pseudoscience and fraudulent psychic phenomena. He had a great interest in religion. His friends and professional acquaintances ranged from John Nash to Douglas Hofstadter to John Milnor to magician James Randi to Ron Graham and Donald Knuth. Martin Gardner thought he had an advantage as a mathematical writer not to have any background in mathematics. He said that, if he could not understand an idea, then his readers would not understand it either. Gardner prepared each of his columns in a painstaking and scholarly fashion and conducted copious correspondence to be sure that he got all the ideas straight. He was humble and straightforward and was at ease approaching even great minds with his questions. Every few years there is a gathering to celebrate Martin Gardner and his contributions to our intellectual culture. The last such meeting was attended by 1,400 people. Clearly Gardner will be remembered for many years to come.

## Paul George Malliavin

On June 3, 2010, Paul Malliavin died at the American Hospital in Paris. At the time of his death, he was four months short of his eighty-fifth birthday. Malliavin was a major mathematical figure throughout his career. He studied under Szolem Mandelbrojt, who had returned to France after World War II from the United States, where he had been on the faculty of what, at the time, was the Rice Institute. Both Malliavin and Jean-Pierre Kahane received their degrees under Mandelbrojt in 1954, and Yitzhak Katznelson received his from Mandelbrojt a couple of years later. Thus, in less than three years, Mandelbrojt produced three students who would go on to become major figures in mid-twentieth-century harmonic analysis. Malliavin's own singular contribution to harmonic analysis is described here by Kahane. Like many other definitive solutions to mathematical problems, Malliavin's solution to the spectral synthesis problem killed the field, with the ironic consequence that few young mathematicians even know the statement of the problem, much less the name of the person responsible for its solution. Not one to rest on his laurels, Malliavin soon turned his attention in new directions. His early work won him an invitation to visit Arne Beurling at the Institute for Advanced Study, where, as Kahane explains here, during a second visit, Malliavin and Beurling completely solved two fundamental problems in classical complex variable theory. After completing his project with Beurling, he thought about complex variable theory and expanded his interests to include analytic functions of more than one variable. This line of research

culminated in his joint paper, with his wife Marie-Paule Malliavin. As Gundy explains in his essay here, this paper represents a departure from classical, purely analytic thinking about analytic functions and potential theory. Instead, the ideas in the Malliavin and Malliavin paper can be seen as descendants of stochastic analytic techniques with which Joseph Doob had given a novel derivation of the Fatou theorem for analytic functions on the disk. It would appear that Malliavin's excursion into probability theory made a lasting impression on him. Ever since Laplace, France has had a proud tradition in probability theory. At the turn of the twentieth century, Emile Borel and Henri Lebesgue were laying the foundations on which Andrey Kolmogorov would build the axiom system which has become the generally accepted one for the mathematical analysis of random phenomena. At the same time, Henri Poincaré's student Louis Bachelier was constructing the model which has recently provided employment for many young mathematicians in the financial industry. That tradition was continued in France by Paul Lévy, whose uncanny understanding of stochastic processes became, once it was explained to the rest of us by Kyoshi Itô, the basis for much of the work that probabilists have done ever since. Further, under the masterful tutelage of Jacques Neveu and, on the more analytic side, Gustave Choquet, postwar France was producing a new cohort of mathematicians whose primary interest was probability theory. Until recently, perhaps the most influential of these was Choquet's student Paul-André Meyer, who realized that, in their haste, Lévy, Doob, and others had treated several notions too casually, a situation that Meyer, first by himself and later with his student Claude Dellacherie, remedied. In spite of the existence of many active French research groups in probability theory, Malliavin charted his own course. He came to the subject as an analyst with wide-ranging interests, and he brought to the subject a vision which only someone with his encyclopedic knowledge of mathematics could provide. Free from prejudice about what topics and methods are or are not "probabilistic", Malliavin trained his formidable technical expertise on aspects of the field that had not been fully considered. His initial project was to understand Brownian motion on a Riemannian manifold from a differential geometric standpoint. Building on a key observation made by David Elworthy and James Eells, Malliavin understood that the Brownian motion on a manifold could be realized by "rolling" a Euclidean Brownian motion in the tangent space onto the manifold. In order to overcome the technical difficulties posed by the nondifferentiability of Brownian paths, he lifted everything to the bundle of orthonormal frames, where he could apply well-established techniques from Itô stochastic differential calculus. As a result, he gave an elegant construction of the Brownian paths on the manifold, one in which they came equipped with an intrinsic notion of parallel transport. Malliavin's ideas were quickly absorbed and exploited by Jean-Michel Bismut, who used them in his proof of the Atiyah–Singer index theorem. Having thoroughly assimilated Itô calculus, Malliavin began to realize that Itô's stochastic differential equations could be viewed as a prescription for defining nonlinear transformations of Wiener space, transformations that, although they are defined only up to a set of Wiener measure 0, are nonetheless "smooth" and, as such, are susceptible to analysis. This realization was the origin of what Malliavin called the stochastic calculus of variations and what one of the present authors dubbed the "Malliavin calculus", a cursory résumé of whose initial formulation is given below. Not content to have been its inventor, Malliavin played a leading role in the application of the Malliavin calculus. Over the past twenty-five years, he and his collaborators produced a large body of work in which his calculus played a central role. The essay here by Leonard Gross gives a glimpse into one of the programs in which Malliavin was involved at the time of his death. Missing here are accounts of the many other projects in which Malliavin was engaged. For example, together with his son-in-law Anton Thalmaier, Malliavin wrote a book in 2000 in which various applications of his calculus to mathematical finance are proposed. Finally, we have included here an homage to Malliavin composed by Michele Vergne. Her essay portrays Malliavin the man, not just Malliavin the mathematician. Most people, even those who have made profound contributions, are unable to sustain their vigor and eventually enter their dotage. Malliavin never did. Indeed, his student and longtime collaborator Hélène Airault was at his bedside as he was dying, and she reports that he was discussing mathematics from behind the oxygen mask covering his face. He was a remarkable individual, and, at least for those of us who were privileged to know him, the world will be a less interesting place now that he is gone.

Peter Hilton

Peter Hilton was born in London on April 7, 1923, to Elizabeth Freedman and a family physician, Mortimer Hilton, whose office was in Peckham. His parents hoped that he would become either a doctor (as his brother Sydney did) or a lawyer. Fate first intervened when he was run over by a Rolls Royce at the age of ten. During a long hospital stay he discovered that he could use the plaster cast on his left leg, which reached all the way to his navel, as a sort of white board; he solved mathematical problems on it, erasing them each morning. This is when, in his words, "It came to me that I really loved mathematics and thoroughly enjoyed doing it. I recall even having unkind thoughts about visitors who came to see if I was all right, as they would interrupt

me when I was really enjoying what I was doing.” He attended St. Paul’s School in Hammersmith, where, being enlightened educators, they left him to study what he wanted in the later years. With unexplained prescience about the unrest leading up to World War II, he decided to teach himself German. He then won a scholarship to Queen’s College, Oxford, where he read mathematics. When he was eighteen, fate intervened for a second time. Peter began work at Bletchley Park in January 1942 (see Copeland’s contribution below for more details); he thereby avoided service in the military, where, as Peter said at the time, “I would surely die—of boredom!” On Peter’s eightieth birthday, Shaun Wylie, Peter’s coauthor, wrote: “This young chap from Oxford joined us in Hut 8 at Bletchley, and soon made his mark. When he moved on to work on Fish, he did more than that; he dominated his section . . . he was brilliant at his job and enormous fun to be with.” Peter was awarded an M.A. at Oxford in 1948, a D.Phil. from Oxford in 1950 for his thesis, Calculation of the Homotopy Groups of  $A_{2n}$ -Polyhedra, and a Ph.D. from Cambridge in 1952. He married Margaret (Meg) Mostyn on September 14, 1949; they had two sons, Nicholas and Tim. Peter and Meg shared a love of theater, Meg professionally and Peter very much less formally. Indirectly, Peter’s love of theater led to our meeting. In 1977 I was asked to get George Pólya, with whom I had been studying informally for about ten years, and Peter together to do a presentation at a joint meeting of the Mathematical Association of America (MAA) and AMS in Seattle. They wanted Hilton to tell about “How Not to Teach Mathematics” and then have Pólya give “Some Rules of Thumb”. When I wrote to Peter, he said “No!” He thought it would be more interesting (and fun) if he simulated a thoroughly bad demonstration of teaching mathematics, and he agreed to do that, instead, if I would be the moderator. The lectures took place on August 14, 1977. A repeat performance, which was televised [1], took place in the fall of 1978 at the San Diego meeting of the National Council of Teachers of Mathematics. Peter then agreed to come to Santa Clara University to give a colloquium talk. When he saw my office and heard about my interest in geometry, we discovered we both had a strong interest in polyhedra (from totally different points of view), and, as they say, the rest is history! Our mutual interest lay in the mathematics involved with geometry. Peter got interested in an algorithm I had developed that concerned a systematic method of folding a straight strip of paper, say, adding-machine tape, that produced increasingly good approximations for any given rational multiple of  $\pi$ , at equally spaced points along an edge of the paper. We began working seriously on it in January of 1981 when we were both at the Eidgenössische Technische Hochschule (ETH) in Zürich. This naturally took us into number theory, polyhedral geometry, and combinatorics, and it continued for over thirty years until the time of Peter’s death. The relevant mathematics is chronicled in our most recent book, *A Mathematical Tapestry: Demonstrating the Beautiful Unity of Mathematics* [2]. In Section 16.6 we wrote about “Pólya and ourselves—Mathematics, tea and cakes”, which describes, as the title suggests, more about our interactions with each other and with Pólya. An event that demonstrates the joie de vivre of collaborating with Peter involved the construction of a figure for one of our articles. We needed a star  $\{113\}$ -gon (i.e., the top edge of the tape would visit every third vertex of a bounding regular convex 11-gon). I had pulled the tape a little too tight and got a star  $\{103\}$ -gon. When I reported this mishap to Peter he said cheerfully, “Don’t worry, we say in the beginning these are only approximations!” He never failed to see the humorous side of things. Although Peter excelled at abstract thinking, he always applied mathematics to real life. He came to understand the principle of mathematical induction at the age of seven when drying dishes for his mother. He realized that the old trick of drying two plates at a time could, in theory, be extended by induction to  $n$  plates. As for applying mathematics to social situations, Sir Christopher Zeeman said in his letter on Peter’s eightieth birthday: “From you I also learned how to talk politics, without endangering friendship. You taught me that if we disagreed about some conclusions then we should go back and examine our beliefs about the underlying facts. You acknowledged that if you believed in my version of the facts then you would share my conclusions, and you persuaded me that if I believed in your version of the facts then I would share your conclusions. It was a kind of mathematical approach; an agreement about the proofs, whatever the hypotheses and theorems. It was a lesson that has served me well throughout my life, in conversations about everything under the sun.” I was blessed with two great mentors, first George Pólya (for far too short a time) and then Peter Hilton. Pólya introduced me to polyhedral geometry, the wonders of “looking for patterns”, and the importance of posing problems. Peter showed me how to generalize and how to see connections between various parts of mathematics. Both Pólya and Peter made the doing of mathematics an adventure constantly filled with excitement. Together Peter and I coauthored 144 papers and 6 books, often giving joint lectures on our current topic of interest. My family was enriched by our friendship with Peter’s family. I was excited to watch Meg perform (as Jim Dale’s mother) in the production of the Broadway Tony-Award-winning play, *A Day in the Death of Joe Egg* (right after she won the Clarence Dewent award for her role in *Molly*). I have fond memories of Peter, Meg, Kent (my husband), and me on our land-cruise tour of Alaska. I smile recalling when Kent, Peter, and I walked through some drizzly California redwoods on what Peter called a “lovely London day”, and later we played three-handed bridge at our house (where Peter got the bid with an appallingly bad dummy). I will always miss Peter, but I am grateful for the memories and the years of collaboration we shared.

### The Booker Prize 2010

The Man Booker Prize for Fiction, also known in short as the Booker Prize, is a literary prize awarded each year for the best original full-length novel, written in the English language, by a citizen of either the Commonwealth of Nations or the Republic of Ireland. When administration of the prize was transferred to the Booker Prize Foundation in 2002, the title sponsor became the investment company Man Group, which opted to retain "Booker" as part of the official title of the prize. ## Buku-buku Sains Matematik Melayu 2011

Amatlah menyediakan dan memalukan, daripada ribuan ahli sains matematik Malaysia amatlah sedikit (tidak sampai 20 buah!) buku sains matematik yang terhasil setiap tahun berlalu. Nampaknya mereka tidak berkarya dalam bentuk penulisan buku dalam bahasa kebangsaannya sendiri kerana kegersangan swa-kesedaran dan swa-keinsafan mereka terhadap keperluan membina tamadun bangsanya. Berikut ialah buku-buku yang dapat kami jumpai penerbitannya dalam tempoh 2011.
